

Manual for PM Reef Ceramic Products

Thank you for the decision in the range of our products.

Due to this, you are actively spent your contribution to all the overexploitation of rocks out of the ocean.

For a long happiness with our products, you find a few recommended tips below;

- You can run your tank without Live-Rocks, this is absolute possible. We had great results not using Live Rocks. If you decide in doing this possibility, it is essential to dose Bacteria-Mix as well as Bacteria-Food for starting saltwater aquarium. (as the description of the product says)
- Flushing your PM Reef Ceramic Product, there could be certain arrears onto the product from production and/or transportation/storage.
- Don't use any trivets, make you put your product onto the bottom without any sand corals underneath.
- When you cycle your Aquarium, please use Ro/Di water and additional, use Silicarbon Adsorber.

If you have questions or you do further structural work on your tank, you certainly can contact your retail store of PM Reef Ceramic or us. There is always help for you.
